I wanted to put a quick documentation into this file because the different text files might be confusing.

Data.txt – Whenever I generated new event numbers, I outputted them into that file with the data number associated with it. For example, the first time you refill numbers, it is data set #2, since #1 was the original set of numbers.

Log.txt – This is everything that goes on in the simulation and a time index at the start of each entry. It gets very long, especially if you run more than 3 simulations because simulation 1 takes 1000+ time intervals on average, meaning 1000+ endlines in the file.

Thank you!
